

Countertop manufacturer benefits from use of roller tables to maneuver sections of raw material for fabricating

To more easily maneuver countertops or workpieces, roller tables mounted on a guide rail were installed. The tables are situated so that material sections can be transferred to various machines along a process flow line. The tables are easily rolled; a rail guides the direction of the table without the need for added employee assistance. The roller table/rail system allows sections to be transferred to the various machine-workstations where they can then be easily transferred onto a machine.

Guide rail

The roller tabletops allow for easy moving and positioning of countertops or workpieces.

Employees feel the guided roller tables have reduced the manual force and time requirements for the task, adding to overall process efficiency.
